## **Description of Problem** $P_{\alpha,\beta}$

$$\partial_t^2 w - \alpha \Delta \partial_t w - \beta \Delta w + \partial_t u = f$$
 on  $[0, T] \times \Omega$  (1)

$$\partial_t u - \Delta u + \gamma(u) + g(u) \ni \partial_t w$$
 on  $[0, T] \times \Omega$  (2)

$$\partial_n w = 0, \qquad \partial_n u = 0 \qquad \text{on } [0, T] \times \partial \Omega$$
 (3)

$$w(0, \cdot) = w_0, \quad \partial_t w(0, \cdot) = v_0, \quad u(0, \cdot) = u_0 \quad \text{on } \Omega.$$
 (4)

- $\Omega \subseteq \mathbb{R}^3$  is a bounded smooth domain, T > 0 a finite time;
- *u* is the phase variable;
- *w* is the thermal displacement: if  $\theta$  is the temperature, then by definition

$$w(t, x) = w_0(x) + \int_0^t \theta(s, x) \, ds \qquad ext{for } (t, x) \in [0, T] imes \Omega;$$

 α, β > 0 are parameters, γ ⊆ ℝ<sup>2</sup> is a maximal monotone graph, g a Lipschitz–continuous function on ℝ, f a given source term. • Let

 $\phi:\mathbb{R}\longrightarrow [0,\,+\infty]$   $\$  be a proper l.s.c. convex function,

$$\phi(0) = 0, \qquad \partial \phi = \gamma,$$

and let *G* be a smooth function s.t. G' = g. If we define the **free** energy

$$\psi(\theta, u) = \int_{\Omega} \left\{ \frac{1}{2} |\nabla u|^2 + \phi(u) + G(u) - \frac{1}{2}\theta^2 - \theta u \right\} ,$$

then the equation (2) follows from

$$\partial_t u + d_u \psi(\theta, u) = 0.$$

• The equation (1) expresses the energetic balance

$$\partial_t (\theta + u) + \operatorname{div} \mathbf{q} = f$$

where  $\theta + u = -d_{\theta}\psi(\theta, u)$  is the enthalpy and **q** the thermal flux.

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ = 臣 = のへで

#### Some examples for the **bulk potential** $\phi$ + *G*:

• the Caginalp "double well" potential

$$\phi(u) + G(u) = (1 - u^2)^2, \qquad u \in \mathbb{R};$$

• the logaritmic potential, defined on (-1, 1) by

$$\gamma(u) = \log(1+u) - \log(1-u), \quad g(u) = -2u;$$

• the "double obstacle" potential, s.t.

$$\gamma = \partial \mathcal{I}_{[-1,1]}, \quad g(u) = -2u.$$

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Some **constitutive assumptions** for the thermal flux **q**, according to the Green and Naghdi's theory, in the linearized versions:

• Type I (Fourier)

$$\mathbf{q} = -\alpha \nabla \partial_t w \,, \qquad \alpha > 0$$

• Type II (Gurtin–Pipkin)

$$\mathbf{q} = -\beta \nabla w \,, \qquad \beta > 0$$

• Type III  

$$\mathbf{q} = -\alpha \nabla \partial_t w - \beta \nabla w , \qquad \alpha, \beta > 0 .$$

In this work, we consider:

Problem  $\mathbf{P}_{\alpha,\beta}$  Type III

Limit as  $\beta \searrow 0$  Type I

Limit as  $\alpha \searrow 0$  Type II

We assume

$$f \in L^{2}(0, T; V') + L^{1}(0, T; H)$$
(5)

$$w_0 \in V$$
,  $v_0 \in H$ ,  $u_0 \in H$ ,  $\phi(u_0) \in L^1(\Omega)$ . (6)

**Theorem** (Existence and uniqueness for Problem  $\mathbf{P}_{\alpha,\beta}$ )

*Under the assumptions* (5)–(6), *Problem*  $\mathbf{P}_{\alpha,\beta}$  *admits a unique solution.* 

The proof is based on

- the Faedo–Galerkin approximation scheme;
- the Yosida regularization of  $\gamma$ :

$$\gamma_{\varepsilon} = rac{1}{arepsilon} \left\{ \mathrm{Id} - (\mathrm{Id} + arepsilon \gamma)^{-1} 
ight\} \,, \qquad 0 < arepsilon \leq 1 \,.$$

### **Theorem** (Regularity and strong solution)

#### If the hypotheses

$$T \in L^2(0, T; H) + L^1(0, T; V)$$
 (7)

$$w_0 \in W$$
,  $v_0 \in V$ ,  $u_0 \in V$ ,  $\phi(u_0) \in L^1(\Omega)$ , (8)

hold, then the solution  $(w, u, \xi)$  of Problem  $\mathbf{P}_{\alpha, \beta}$  fulfills

$$w \in W^{2,1}(0, T; H) \cap W^{1,\infty}(0, T; V) \cap H^1(0, T; W)$$

$$u \in H^1(0, T; H) \cap C^0([0, T]; V) \cap L^2(0, T; W)$$

*and, in particular, it is a strong solution, i.e., it satisfies the equations* (1)–(4) *pointwise a.e.* 

The two results above hold true when  $\Omega \subseteq \mathbb{R}^N$ , for all  $N \ge 1$ . On the other hand, the assumption  $N \le 3$  will be exploited in the sequel.

▲□▶▲□▶▲□▶▲□▶ □ のQで

#### **Theorem** ( $L^{\infty}$ estimates)

*Let*  $\gamma^0(s)$  *denote the unique element of*  $\gamma(s)$  *having minimal modulus, for all*  $s \in \mathbb{R}$ *. In addition to (7)–(8), we assume* 

$$u_0 \in W, \qquad u_0 \in D(\gamma) \quad q.o., \qquad \gamma^0(u_0) \in H;$$
(9)

then, we have

 $u \in W^{1,\infty}(0, T; H) \cap H^{1}(0, T; V) \cap L^{\infty}(0, T; W)$ and, in particular,  $u \in C^{0}([0, T] \times \overline{\Omega})$ . Furthermore, if the assumptions  $f \in L^{\infty}(0, T; H) + L^{r}(0, T; V)$  for some r > 4/3 (10)  $\gamma^{0}(u_{0}) \in L^{\infty}(\Omega)$  (11)

hold, then

$$\partial_t w \in L^\infty((0, T) \times \Omega), \qquad \xi \in L^\infty((0, T) \times \Omega).$$

## **Limit as** $\beta \searrow 0$

In this section  $\alpha > 0$  is fixed. We denote by  $(w_{\beta}, u_{\beta}, \xi_{\beta})$  the solution of Problem  $\mathbf{P}_{\alpha, \beta}$ .

**Question.** We ask whether, as  $\beta \searrow 0$ , there is any convergence

$$(w_{\beta}, u_{\beta}, \xi_{\beta}) \longrightarrow (w, u, \xi),$$

where  $(w, u, \xi)$  is a solution of Problem **P**<sub> $\alpha$ </sub>:

$$\partial_t^2 w - \alpha \Delta \partial_t w + \partial_t u = f \quad \text{on } [0, T] \times \Omega$$
  
$$\partial_t u - \Delta u + \xi + g(u) = \partial_t w \quad \text{on } [0, T] \times \Omega$$
  
$$u \in D(\gamma), \quad \xi \in \gamma(u) \quad \text{a.e. on } [0, T] \times \Omega$$
  
$$\partial_n w = 0, \quad \partial_n u = 0 \quad \text{on } [0, T] \times \partial \Omega$$
  
$$w(\cdot, 0) = w_0, \quad \partial_t w(\cdot, 0) = v_0, \quad u(\cdot, 0) = u_0 \quad \text{on } \Omega.$$

◆□▶ ◆課▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

#### **Theorem** (First error estimate as $\beta \searrow 0$ )

Under the assumptions (5)–(6), Problem  $\mathbf{P}_{\alpha}$  has a unique solution; that is, there exists a unique triplet  $(w, u, \xi)$  fulfilling

 $w \in W^{2,\,1}\left(0,\,T;\,V'
ight) \cap W^{1,\,\infty}\left(0,\,T;\,H
ight) \cap H^{1}\left(0,\,T;\,V
ight)$ 

 $u \in H^1(0, T; V') \cap C^0([0, T]; H) \cap L^2(0, T; V)$ 

 $\xi \in L^2([0, T] \times \Omega)$ ,  $u \in D(\gamma)$  and  $\xi \in \gamma(u)$  a.e.

 $\left\langle \partial_t^2 w(t), v \right\rangle + \alpha \left( \nabla \partial_t w(t), \nabla v \right)_H + \left\langle \partial_t u(t), v \right\rangle = \left\langle f(t), v \right\rangle$ 

 $\langle \partial_t u(t), v \rangle + (\nabla u(t), \nabla v)_H + (\xi(t) + g(u)(t), v)_H = (\partial_t w(t), v)_H$ 

for all  $v \in V$  and a.a.  $t \in [0, T]$ . Furthermore, there is a constant *c* independent of  $\beta$  s.t.

$$\|w_{\beta} - w\|_{H^{1}(0, T; H) \cap L^{\infty}(0, T; V)} + \|u_{\beta} - u\|_{L^{\infty}(0, T; H) \cap L^{2}(0, T; V)} \le c\beta$$

#### ◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

We have better estimates on the convergence error when  $\gamma$  is a single–valued, smooth function (e.g.: "double–well" or logarithmic potential).

**Theorem** (Second error estimate as  $\beta \searrow 0$ )

Suppose that  $\gamma : D(\gamma) \longrightarrow \mathbb{R}$  is a single–valued, locally Lipschitz–continuous function, and that f and the initial data fulfill the strongest hypotheses. Then, the estimate

$$\begin{aligned} \|w_{\beta} - w\|_{W^{1,\infty}(0,T;V)\cap H^{1}(0,T;W)} + \\ \|u_{\beta} - u\|_{H^{1}(0,T;H)\cap L^{\infty}(0,T;V)\cap L^{2}(0,T;W)} &\leq c\beta \,, \end{aligned}$$

holds true, for some constant c independent of  $\beta$ .

## **Limit as** $\alpha \searrow 0$

Let us fix  $\beta > 0$  once and for all. We denote by  $(w_{\alpha}, u_{\alpha}, \xi_{\alpha})$  the solution of Problem  $\mathbf{P}_{\alpha,\beta}$ .

**Question.** As  $\alpha \searrow 0$ , we ask whether the convergence

$$(w_{\alpha}, u_{\alpha}, \xi_{\alpha}) \longrightarrow (w, u, \xi), \qquad (12)$$

holds in some sense, where  $(w, u, \xi)$  is a solution of Problem **P**<sub> $\beta$ </sub>:

$$\partial_t^2 w - \beta \Delta w + \partial_t u = f \quad \text{on } [0, T] \times \Omega$$
  
$$\partial_t u - \Delta u + \xi + g(u) = \partial_t w \quad \text{on } [0, T] \times \Omega$$
  
$$u \in D(\gamma), \quad \xi \in \gamma(u) \quad \text{a.e. on } [0, T] \times \Omega$$
  
$$\partial_n w = 0, \quad \partial_n u = 0 \quad \text{on } [0, T] \times \partial \Omega$$
  
$$w(\cdot, 0) = w_0, \quad \partial_t w(\cdot, 0) = v_0, \quad u(\cdot, 0) = u_0 \quad \text{on } \Omega.$$

The well–posedness of Problem  $\mathbf{P}_{\beta}$  is already proved in literature.

- Assuming (5)–(6), we can prove the *weak* convergence in (12).
- Under stronger hypotheses, we infer the strong convergence, with an estimate on the convergence error.

### **Theorem** (First error estimate as $\alpha \searrow 0$ )

*If we assume* (5)–(6), as well as

$$f \in L^2(0, T; H) + L^1(0, T; V)$$

 $w_0 \in W$ ,  $v_0 \in V$ ,  $u_0 \in V$ ,  $\phi(u_0) \in L^1(\Omega)$ ,

then there exists a constant *c*, independent of  $\alpha$ , s.t.

$$\begin{aligned} \|w_{\alpha} - w\|_{W^{1,\infty}(0,T;H) \cap L^{\infty}(0,T;V)} + \\ \|u_{\alpha} - u\|_{L^{\infty}(0,T;H) \cap L^{2}(0,T;V)} \le c\alpha^{1/2} \end{aligned}$$

・ロト・日本・日本・日本・日本・日本

• For the proof, it is convenient to introduce the new variable

$$y(t, x) := \int_0^t u(s, x) \, ds + w(t, x) \qquad ext{for} \quad (t, x) \in [0, T] imes \Omega \, .$$

• We obtain better estimates on the convergence error when

$$\gamma : \mathbb{R} \longrightarrow \mathbb{R} \text{ is a single-valued,}$$
locally Lipschitz–continuous function (13)

(e.g.: the Caginalp "double well" potential).

 If (13) holds, we can prove regularity results for Problems P<sub>α, β</sub> and P<sub>β</sub>, with α-independent estimates on the solution.

Description of the model	Study of Problem P $_{\alpha,\ \beta}$	Limit as $\beta \searrow 0$	Limit as $\alpha \searrow 0$
Theorem (S	econd error estimate	as $\alpha \searrow 0$ )	
In addition to	o (13), we require		

$$f \in W^{2,1}(0, T; H) + W^{1,1}(0, T; V)$$

 $w_0 \in W$ ,  $v_0 \in W$ ,  $u_0 \in H^3(\Omega) \cap W$ ,  $\alpha \Delta v_0 + \beta \Delta v_0 + f(0) \in V$ . Then, there exists a constant *c*, independent of  $\alpha$ , which fulfills

$$\begin{split} \|w_{\alpha} - w\|_{W^{1,\infty}(0,T;H) \cap L^{\infty}(0,T;V)} + \\ \|u_{\alpha} - u\|_{H^{1}(0,T;H) \cap L^{\infty}(0,T;V) \cap L^{2}(0,T;W)} &\leq c\alpha \\ \|w_{\alpha} - w\|_{W^{1,\infty}(0,T;V) \cap L^{\infty}(0,T;W)} &\leq c\alpha^{1/2} \,. \end{split}$$

## **Final remarks**

- All the results hold true when  $\Omega \subseteq \mathbb{R}^3$  is, for instance, a convex polyhedron.
- Problem P<sub>α,β</sub> can be exploited to approximate Problem P<sub>β</sub>, via an artificial viscosity method. The convergence results as α ↘ 0 can therefore be interpreted as estimates on the consistency error.
- Possible generalizations of this model:
  - Non linear coupling of  $\theta$  and u in the free energy functional

$$\overline{\psi}(\theta, u) = \int_{\Omega} \left\{ \frac{1}{2} |\nabla u|^2 + \phi(u) + G(u) - \frac{1}{2}\theta^2 - h(u)\theta \right\};$$

- Non linearized versions of the Green and Nagdhi's constitutive hypotheses.
