Uniqueness theorem

Let the same Hypotheses hold, and let (ϑ_1, χ_1) , (ϑ_2, χ_2) be solutions to our problem associated with respective boundary and initial data $\vartheta_{\Gamma 1}, \vartheta_{01}, \chi_{01}$ and $\vartheta_{\Gamma 2}, \vartheta_{02}, \chi_{02}$.

Put $\hat{\theta} = \vartheta_1 - \vartheta_2$, $\hat{\chi} = \chi_1 - \chi_2$, $\hat{\theta}_{\Gamma} = \vartheta_{\Gamma 1} - \vartheta_{\Gamma 2}$,
 $\hat{\chi}_0 = \chi_{01} - \chi_{02}$, $\hat{\theta}_0 = \vartheta_{01} - \vartheta_{02}$.

Then for every $T > 0$ there exists a constant $C_T > 0$ such that

$$\int_0^T \int_{\Omega} |\hat{\theta}(x, t)|^2 dx dt + \max_{t \in [0, T]} \int_{\Omega} |\hat{\chi}(x, t)|^2 dx \\ \leq C_T \left(|\hat{\theta}_0|_H^2 + |\hat{\chi}_0|_H^2 + \int_0^T \int_{\partial\Omega} \gamma \hat{\theta}_{\Gamma}^2(x, t) ds dt \right).$$

Third auxiliary result

An idea of the proof of existence

Open problems

Remark

- We have the L^1 -Lipschitz continuity in case f is also Lipschitz continuous w.r.t. ϑ : there exists $M > 0$ such that the solutions $\chi_1, \chi_2 \in L^\infty(Q_T)$ associated with $\chi_{01}, \chi_{02} \in \mathcal{D}_C(\varphi)$, $\vartheta_1, \vartheta_2 \in L^1(Q_T)$ satisfy a. e. in Q_∞ :

$$\begin{aligned} & |(\chi_1 - \chi_2)_t(\mathbf{x}, t)| + \frac{\partial}{\partial t} |(\chi_1 - \chi_2)(\mathbf{x}, t)| \\ & \leq M \left(|(\vartheta_1 - \vartheta_2)(\mathbf{x}, t)| + |(f[\chi_1, \vartheta_1] - f[\chi_2, \vartheta_2])(\mathbf{x}, t)| \right). \end{aligned}$$

Remark

- We have the L^1 -Lipschitz continuity in case f is also Lipschitz continuous w.r.t. ϑ : there exists $M > 0$ such that the solutions $\chi_1, \chi_2 \in L^\infty(Q_T)$ associated with $\chi_{01}, \chi_{02} \in \mathcal{D}_C(\varphi)$, $\vartheta_1, \vartheta_2 \in L^1(Q_T)$ satisfy a. e. in Q_∞ :

$$\begin{aligned} & |(\chi_1 - \chi_2)_t(\mathbf{x}, t)| + \frac{\partial}{\partial t} |(\chi_1 - \chi_2)(\mathbf{x}, t)| \\ & \leq M \left(|(\vartheta_1 - \vartheta_2)(\mathbf{x}, t)| + |(f[\chi_1, \vartheta_1] - f[\chi_2, \vartheta_2])(\mathbf{x}, t)| \right). \end{aligned}$$

In case f is also Lipschitz continuous w.r.t. ϑ , integrating over $\Omega \times (0, t)$ and using Gronwall lemma, we obtain the L^1 -Lipschitz continuity.

MOSER ITERATION SCHEME.

Let the following assumptions hold true:

- (i) $\mathcal{H} : L_{\text{loc}}^{\infty}(Q_{\infty}) \rightarrow L_{\text{loc}}^{\infty}(Q_{\infty})$ satisfy $\forall u \in L_{\text{loc}}^{\infty}(Q_{\infty})$
 $u(x, t) \mathcal{H}[u](x, t) \leq H_1 |u(x, t)| + H_0 |u(x, t)|^2$ a. e. in Q_{∞} ,
- (ii) h, γ are suff. regular, $\gamma \geq 0$, a, a_t, u^0, u_{Γ} are sufficiently regular and bdd functions :
 $0 < a_0 \leq a(x, t)$, $|a_t(x, t)| \leq a_1$ a.e. in Q_{∞} ,
- (iii) there exists $u \in L_{\text{loc}}^{\infty}(Q_{\infty}) \cap L_{\text{loc}}^2(0, \infty; H^1)$ solution of

$$\begin{cases} a(x, t)u_t - \Delta u = \mathcal{H}[u] \text{ a. e. on } Q_{\infty} \\ \partial_n u(x, t) + \gamma(x) (h(x, t, u(x, t)) - u_{\Gamma}(x, t)) = 0 \text{ a. e. on } \Sigma_{\infty} \\ u(x, 0) = u^0 \text{ a. e. in } \Omega, \int_{\Omega} |u(x, t)| dx \leq E_0 \text{ a. e. in } (0, \infty). \end{cases}$$

Then there exists $C^* > 0$, depending on the data (but not on a_1, H_0, H_1, E_0) such that, for a. e. $t > 0$, it holds:

$$|u(t)|_{L^{\infty}(\Omega)} \leq C^* (1 + H_0 + a_1)^{1+N/2} (1 + H_1 + E_0).$$
